

COMPSCI 589 Final Project - Spring 2026

Due **May 8**, 11:55 pm Eastern Time

Introduction

- Each group member was responsible for evaluating the performance of at least one unique algorithm implemented during the semester on each dataset
- The algorithms tested in this project were chosen from the pool of: k -NN, Decision Trees, multinomial Naive Bayes, Random Forests, and Neural Networks
- All work was done in the shared github repository https://github.com/19851xw/589_final_project

-
- **Katherine** implemented TODO
 - **Tiffany** implemented TODO
 - **Xing-Wei** implemented Decision Trees

Experiments and Analyses

1 The Hand-Written Digits Recognition Dataset

1.1 Neural Networks Algorithm

TODO

1.2 Algorithm 2

TODO

1.3 Algorithm 3

TODO

Extra Credit

We did the following extra credit tasks. Describe what you did as part of that task and present the corresponding results. Any source code you develop should be included in your Gradescope submission.

[QE.1] [Extra Credit Question #1] (10 Points)

You may earn up to 10 extra points if you analyze all four datasets using an additional algorithm. In other words, you would be evaluating more than two algorithms on each of the datasets discussed in Section 1.

[QE.2] [Extra Credit Question #2] (10 Points)

You may earn up to 10 extra points if you select a new challenging dataset and evaluate the performance of different algorithms on it. A challenging dataset should necessarily include both categorical and numerical attributes and have more than two classes; or it should be a dataset where you have to classify images.

[QE.3] [Extra Credit Question #3] (15 Points)

You may earn up to 15 extra points if you combine different algorithms and construct an ensemble. For instance, you could create an ensemble composed of three neural networks (each with a different architecture) and a random forest. The ensemble would be trained as described in class: each algorithm would be trained on its own bootstrap dataset, and so on. The final predictions would then be determined by majority voting. Evaluate your ensemble algorithm on all four datasets discussed in Section 1.

[QE.3] [Extra Credit Question #3] (15 Points)

You may earn up to 15 extra points if you implement a new type of algorithm—a non-trivial variant of one of the algorithms studied in class. If you choose to do so, you should evaluate its performance on all four datasets.
